Introduction

Le présent texte a pour but de présenter les moyens mis à disposition de la pensée par

la systémique

pour représenter le temps

Les factales

Les hypofactales

Les durofactales

```
when tempale > 10 jours then  
  factale  
end when;
```

Les instofactales

*when chronale then
factale
end when;*

Les statofactales

*when statale > 5% then
factale
end when;*

Les certitales

(ms)

Les perturbations

La dureale

Une duritale émet comme signal

une durale

qui augmente proportionnellement au temps qui passe depuis le début

Elle admet un instant initial décalé

Les instantales

L'élément central de la synchronisation est

la chronitale

Une chronitale est un type d'entitale qui dit quand une partition constituée par un ensemble d'équations est active

Une chronitale émet des chronales qui sont considérées comme

vraies

quand la chronitale est active

Une chronitale active à certains instants particuliers, émettant une chronale à certains instants particuliers et une réale associée à ces chronités

Une réale chronisée n'a de valeur qu'aux chronales de la chronitale

La rotation change de sens toutes les demi secondes

L'intervalle de chronale est changé au même rythme

Toutes les demi secondes il est doublé ou diminué de moitié
